2021 Outlook Theme #1, 6/30/21 Update: Vaccines Reduce the Virus and Volatility

Benjamin B. Wallace, CFA - Portfolio Manager, Research Director

The market's driver in 2021 remains the progress of Covid-19 vaccine roll outs and the re-opening of the economy.

While the vaccine roll out has moved a bit faster than expected, the focus has always been on 6/30/21, when the US would reach vaccination levels near herd immunity.

Looking forward to Q2, we observed on 3/31: *With this optimism, there is also room for disappointment to creep in. Even though Q2'21 will see the near full vaccination of the US adult population, this could be tempered by the combination of more transmissible variants and re-opening economies spurring more cases in the yet to be vaccinated population. The likely feature will be stories of increased cases in younger patients, as this less vaccinated and more active group spurs circulation. The positive feature should be considerably lower severe outcomes (hospitalizations, mortality) due to the already high levels of vaccinations in vulnerable populations.*

And three months later, this is where vaccine headlines are at the end of Q2. Even though there have been some surprises along the way, the general path of improving Covid trends leading to an economy well on its way to normal as of 6/30, has been achieved. Even though the global effort for vaccine roll outs is ongoing, the success in the US and other early vaccinators has maintained the market's confidence that, once they arrive, vaccines will bring a return to normal economic activity.

This is reflected in the equity markets. In April 2020, trailing 1-month average daily volatility reached an all-time record high of 5%. This reading meant that in the month of April, the market moved, on average, 5% PER DAY, either up or down. This level had never been reached before and reflected the tremendous uncertainty of the unfolding pandemic. This uncertainty correlated with the markets decline, as both uncertainty and lower profit expectations were priced.

The subsequent decline in volatility and rising equity prices reflects the growing confidence in profit outlooks. Today, the picture is much different, with the S&P 500 at an all-time high and trailing 1 month volatility of 0.4% near historic lows, reflecting an optimistic profit outlook and overall high level of confidence.

Even though the global vaccine roll-out is only partially complete and variants remain a risk, especially to unvaccinated populations, equity markets remain focused on the vaccinations driving a US, and then global, recovery. There is one catch. Elevated prices and low volatility mean the markets are not pricing much in the way of disappointment. While high valuation and low volatility do not cause markets to fall, it does leave them vulnerable if subsequent events do not turn out as well as hoped. Therefore, it is times like this when we become more vigilant of potential risks on the horizon, even as *Vaccines Reduce the Virus and Volatility*.
