2023 Outlook Theme #1: Can the Fed Set Interest Rates to Cruise Control on “Raise and Hold”?

By Benjamin B. Wallace, CFA

Benjamin B. Wallace, CFA - Portfolio Manager, Research Director

The Fed’s accelerating rate hike timetable, in response to the persistence of inflation, was the major market driver in 2022. In an unprecedented action, it raised rates from 0% to 4.25%, including four straight 75 bps hikes. For 2023, the question will be whether the Fed is cutting rates by year end.

Fed policy weighed on markets for the first three quarters, then reversed in Q4. While the Fed is still raising rates, the pace has slowed, and the market has responded favorably in Q4. As discussed in our 9/30/22 Focal Point, Riveted to the Pivot, the market was highly sensitive to potential shifts in Fed policy, referred to as “the pivot”. The key to the pivot wasn’t that the Fed had to stop raising rates, but merely to suggest a deceleration in the pace of hikes. This played out in Q4, as either Fed comments or key inflation data drove the Q4 reversal of 2022’s market declines. Just two trading days, with 11/10’s CPI “cool” report and a Powell press conference on 11/30, accounted for 5% of the S&P’s 8% Q4 rally and 50 bps of decline in the 10yr yield (in a qtr when the 10yr rose 8 bps).

This interaction is shown in the chart to the left, with Core CPI, implied inflation (from TIPS), and the 1 year Treasury yield (as a proxy for Fed policy). After initially rising, implied inflation has been declining and, after a surge higher, Core CPI has started to come down. The next step would be for the 1yr Treasury to stop rising, as that means markets are pricing a shift in Fed policy. Q4’s “pivot” is evident in the peaking 1yr Treasury.

Entering 2023, the Fed’s policy mantra is “raise and hold”, meaning it plans to complete its rate hikes soon, but then hold them at that level through the end of the year to quell inflationary pressures. The bond market, via interest rates, agrees on the first part, that the Fed will halt its rate hikes soon. It disagrees, though, on the second part, and is pricing rate cuts by the end of the year. The stock market, although lower in 2022, has stabilized amidst hope for a recovery in 2023. 2023 will require a reconciliation of these expectations.

The Fed could be cutting rates before year end for good reasons (inflation has slowed as transitory issues have passed) or bad ones (the economy is in a recession). The stabilized stock market suggests that the economic outlook is no longer deteriorating.

Combining the fixed income and equity views, the markets overall are priced for a soft landing scenario, of moderate, but still positive, growth paired with easing inflation pressures. But this is a narrow window. Stronger growth would be good for equities, but rates, back below 4%, would see pressure to rise again, especially if this allows the Fed to stand its ground on “raise and hold”. Alternatively, if the economic outlook deteriorates, lower rates would make sense, the Fed would likely cut rates and bonds would do well, while stocks would be challenged.

And much like the “soft landing” scenario works for stocks and bonds, a stagflation scenario of a recession paired with persistent inflation would be bad for stocks and bonds, which would be the worst case outcome.

The takeaway is that after a year when both stocks and bonds declined, thanks to an unexpected economic outcome (persistent inflation) driving a change in Fed policy (a fast pace of rate hikes), it is feasible for stocks and bonds to go in different directions, depending on how long the Fed's "raise and hold" policy lasts. For statisticians, 2022 exhibited positive correlation between stocks and bonds, while 2023 has the potential for negative correlation. This may seem esoteric, but negative correlation is key to making the volatility reducing benefits of portfolio diversification effective.

Ironically, the likely source of 2023's economic surprise are the effects of 2022's policy moves. The question is how much the economy will be impacted by lagged effects of this rapid interest rate shift. As much as the Fed wants the economy to remain static long enough for rates to stay at one level, economic developments will necessitate adjustments at some point. *Can the Fed Set Interest rates to Cruise Control on Raise and Hold?*
